## WHAT IS CLAIMED IS:

$^{\circ}$	

1

3	1. A pulse-width modulated digital amplifier comprising:
4	a loop filter for producing a stable loop output signal Ew from an input digital signal Ei,
5	the loop filter including an nth order integrator, n having a value greater than one,
6	the nth order integrator comprising a first integrator and m additional integrators,
7	the first integrator having an absolute magnitude of gain that is greater than the sum of
8	the absolute magnitudes of gains of the m additional integrators; and
9	a comparator for receiving loop output signal Ew and a pre-selected signal, the
10	comparator generating a pulse-width modulated signal Ep from the pre-selected signal and signal
11	Ew,
12	the pre-selected signal comprising a sawtooth wave generated signal;
13	a switching output stage for receiving pulse-modulated signal Ep and generating ar
14	output signal Eo; and
15	a feedback loop for channeling a portion of the signal Eo to the loop filter input and
16	combining with the input signal Ei.
